

Based on Markku Kulmala's comment in Nature 553, 21-23 (2018)

BUILD A GLOBAL EARTH OBSERVATORY

because

Large regions with sparse observations. Knowledge gap to be solved with an integrated network, extensive coverage and exhaustive observations.

LTER
AnaEE
GAW-WMO
ACTRIS
ICOS

Atmosphere
Hydrosphere
Biosphere
Pedosphere
Cryosphere
Anthroposphere

Cost | € 10-20 M per station

compares with

- € 10-20 B per 1000 stations
- € 4-11 B, Large Hadron Collider
- € 10-20 B, Trump's wall

Data sources and details: past to current CO₂ concentration are Mauna Loa measurements as provided by Dr. Pieter Tans, NOAA/ESRL (www.esrl.noaa.gov/gmd/ccgg/trends/) and Dr. Ralph Keeling, Scripps Institution of Oceanography (scrippsco2.ucsd.edu/). Rest of data in the timeline is taken from IPCC data center (www.ipcc-data.org). Warming is expressed in °C as the multi-model average of detrended globally averaged TAS anomalies relative to 1980-1999 as delivered in the IPCC 4th assessment report. Projected CO₂ and warming values are shown for the spectra of possible future scenarios, as described in IPCC reports. Cost of LHC is from CERN-Brochure-2017-002-Eng; cost of Trump's wall extracted from Statista.com, "dimensions-costs-trump-mexico-wall".
